7-9 October 2025, Oak Ridge National Laboratory

Advanced Multi-Rate EMT Emulation Using a Digital Real-Time Simulator for Bulk  
Transmission Systems: A Case Study of the Western Electricity Coordinating Council

Yash Agalgaonkar

This work was authored by the National Renewable Energy Laboratory (NREL) for the U.S. Department of Energy (DOE) under Contract No. DE-AC36-08GO28308. Funding was provided by the U.S. Department of Energy through the Office of Electricity and the Solar Energy Technologies Office. ## Introduction

- Western Electricity Coordination Council (WECC)

## Demonstration

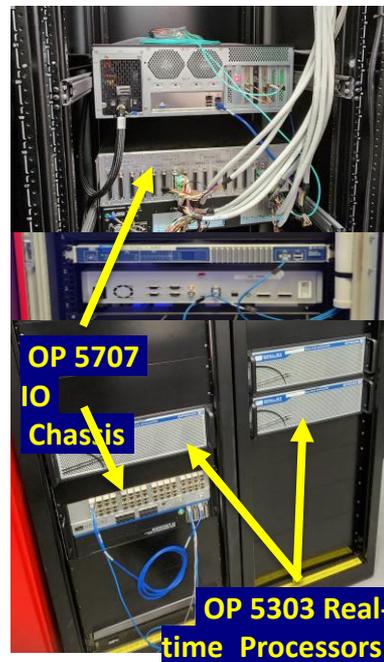

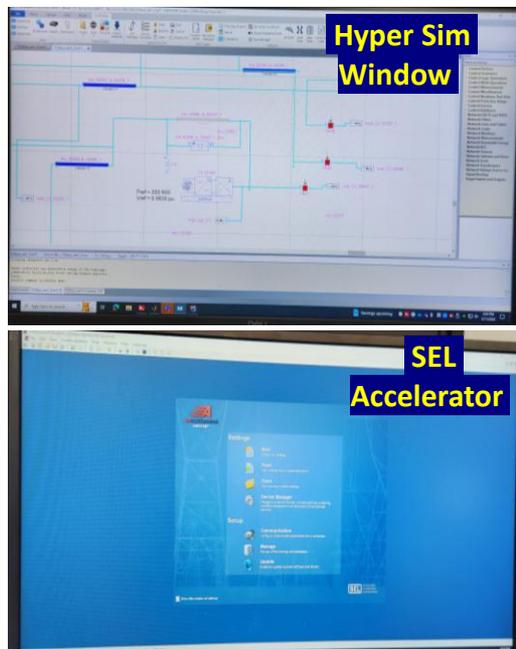

- ARIES Hardware virtual emulation capabilities
- Bulk transmission level digital twin validation
- Data analysis and system stability analysis

## Discussion

# WECC and WAPA Digital Twin on the ARIES VEE

# WECC and WAPA Digital Twin

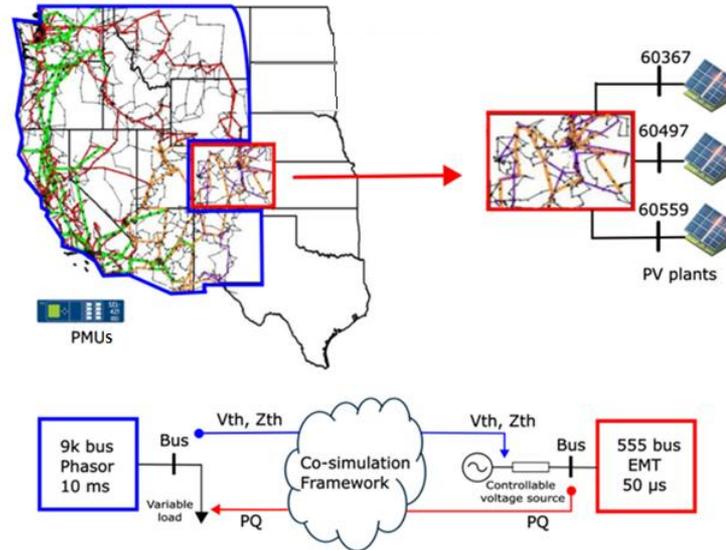

WECC and WAPA digital twin hardware leverages multiple ARIES assets.

# WECC Digital Twin Setup and large EMT model

---

# At-scale WAPA and WECC Multi-Rate Emulation Setup Using the ARIES VEE

NREL has implemented a multi-rate emulation setup for the WECC bulk transmission system, incorporating multiple renewable and classical generation sources

# Comparison of Digital Twin Results with Field Measurements

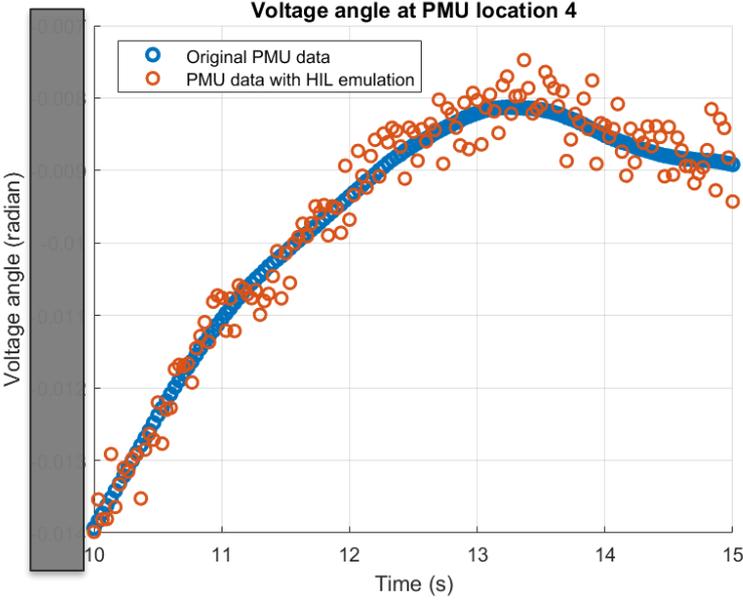

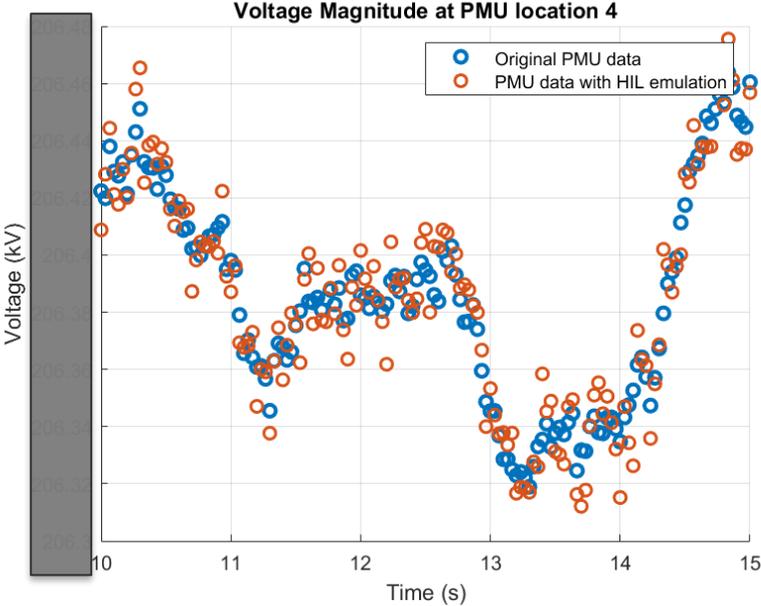

# Model Validation : PMU location 2 measurements

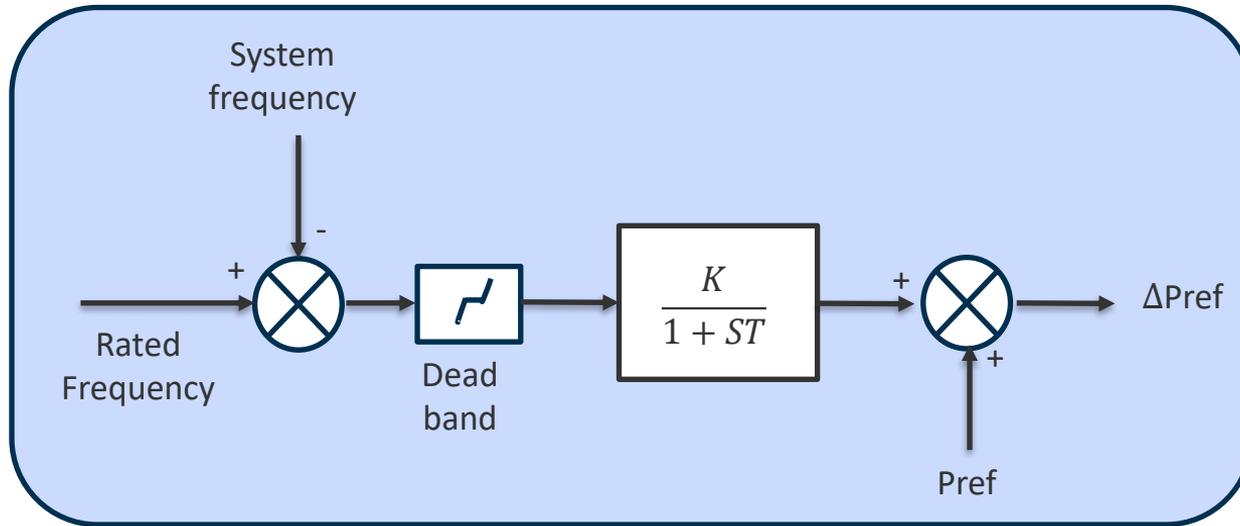

# Model Validation : PMU location 3 measurements

# Model Validation : PMU location 4 measurements

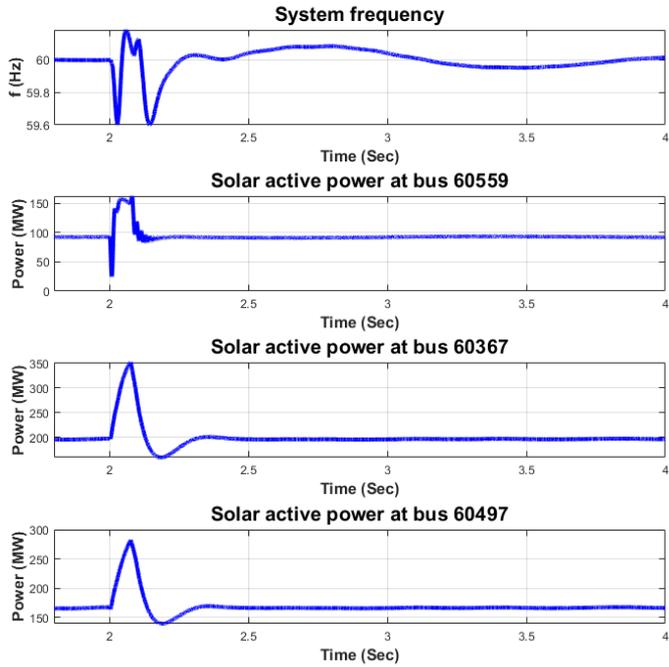

# Frequency Control Using Droop PV

Droop control diagram

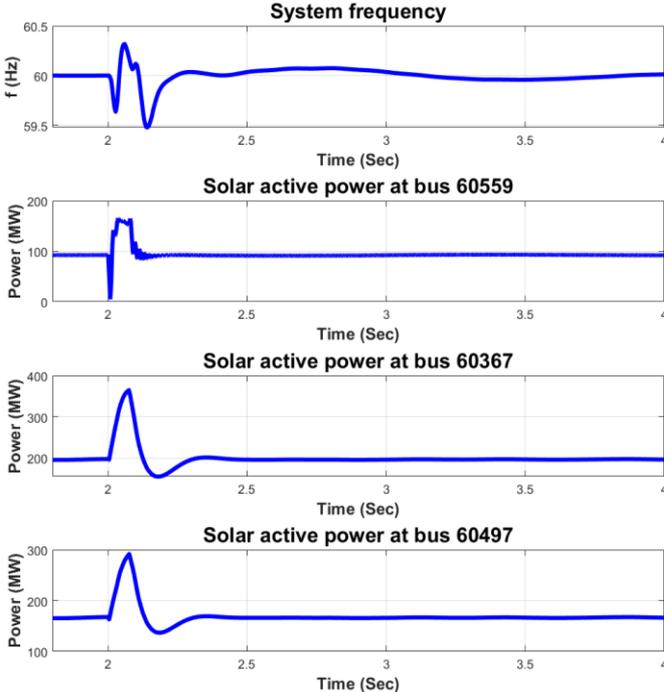

# Frequency Response with 1000 MW Load Change

Change of 1000 MW load in Colorado

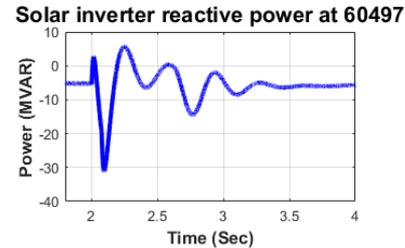

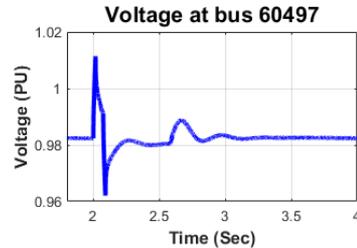

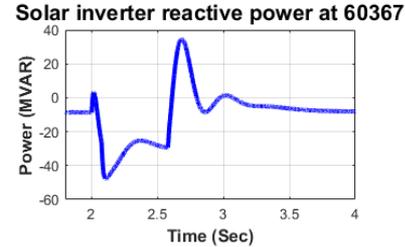

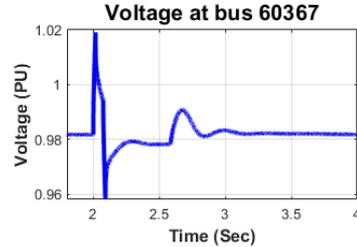

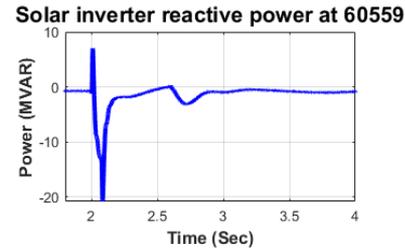

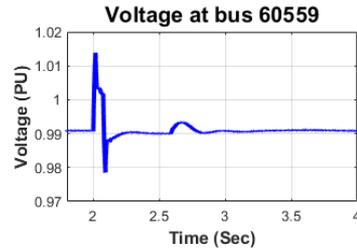

# Frequency Response with 1500 MW Load Change

Change of 1.5 GW load in Colorado

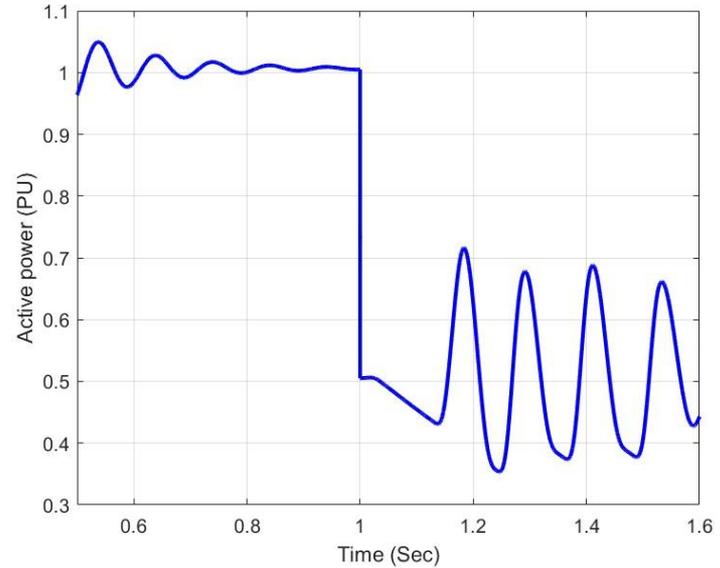

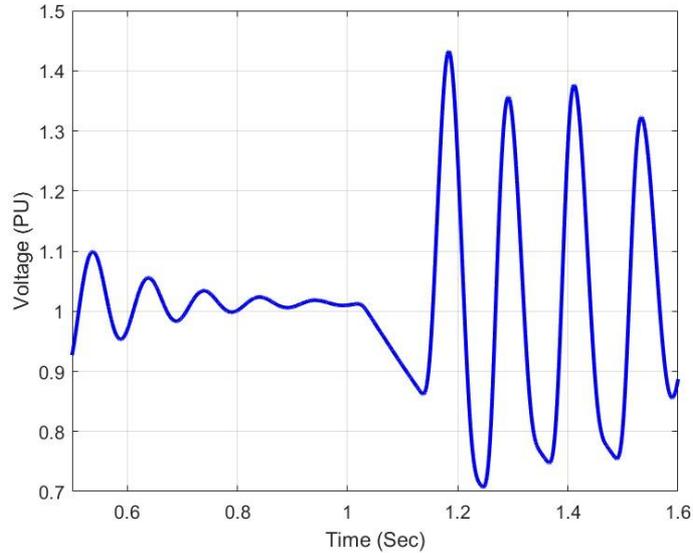

# Voltage Control Using PV Reactive Power

## Solar regulating voltage stability

# Oscillations

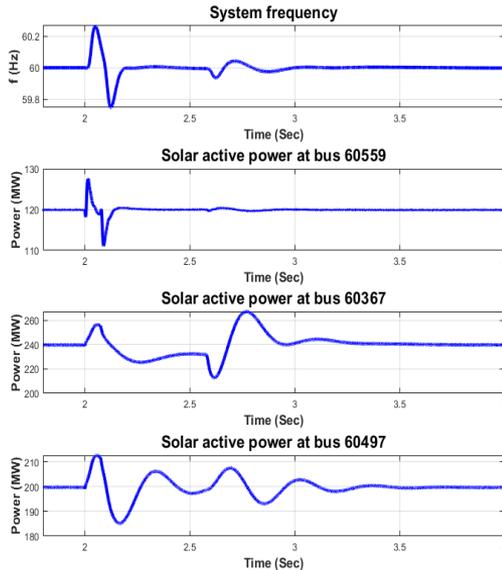

**Oscillations during power grid has weak strength during PV  
ramp down event**

# Stability Analysis Using the DRTS Digital Twin

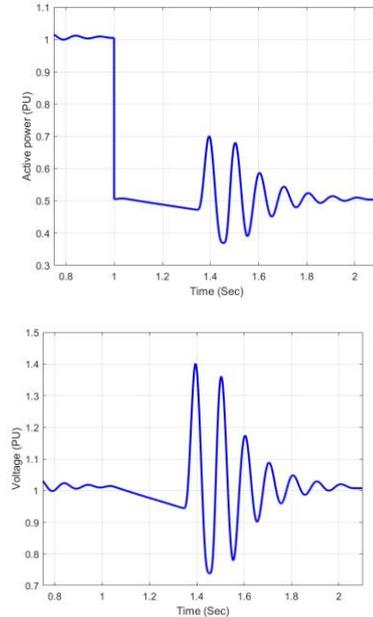

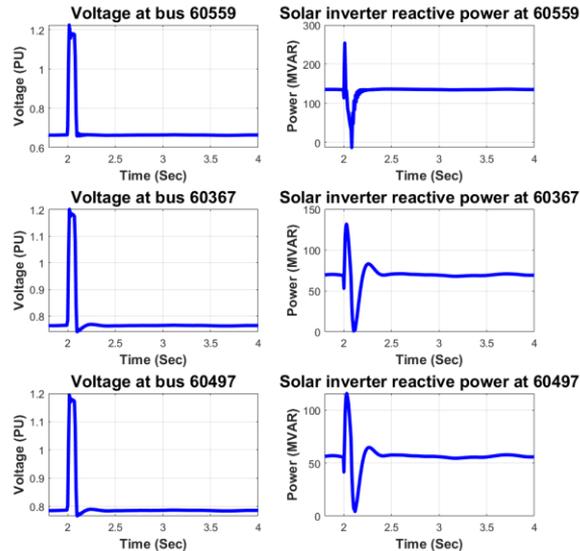

---

# Analysis of Multiple What-if Scenarios and Control Design Using Digital Twin

Change of 500 MW load in Colorado

Solar regulation voltage stability

We can model multiple what-if scenarios, such as wildfires or scenarios similar to the 2021 ERCOT blackout. The digital twin will mimic the system and emulate field conditions.

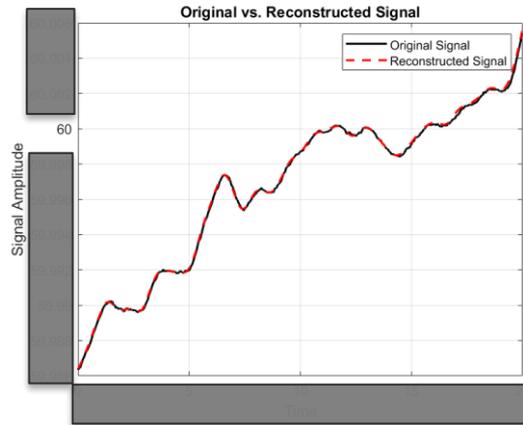

# Data Visualization and Disturbance Monitoring

---

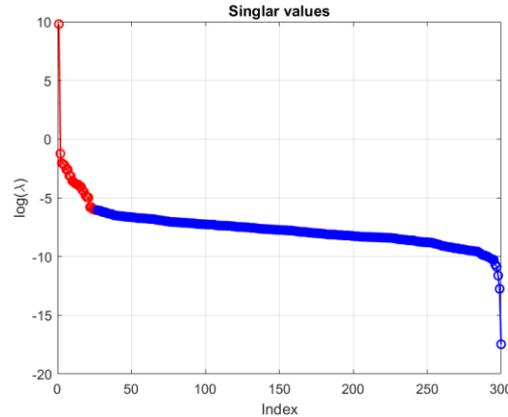

# PMU Location 1 Signal

Event Year: 2019

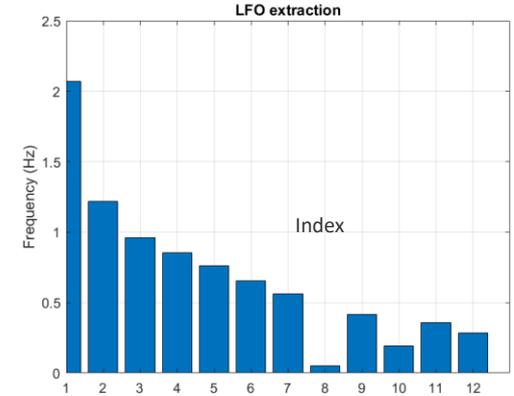

Event Length: 20 Seconds

Signal reconstruction

Dominant singular values

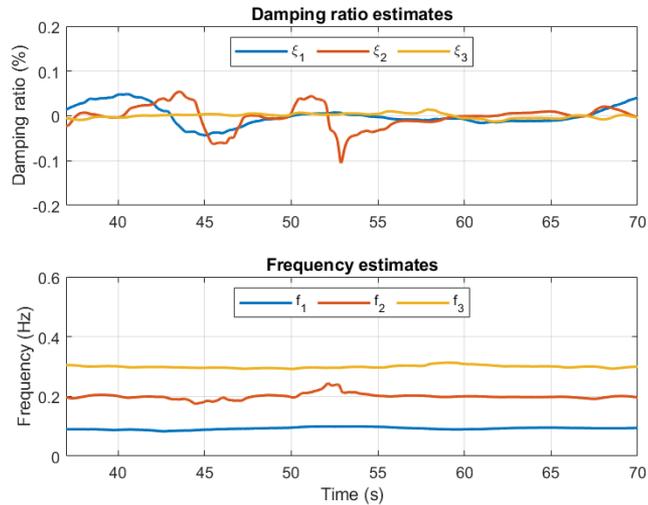

Frequency components

We have five years of WAPA historical data. Big data analytics can be used to capture system anomalies through fault signature detection.

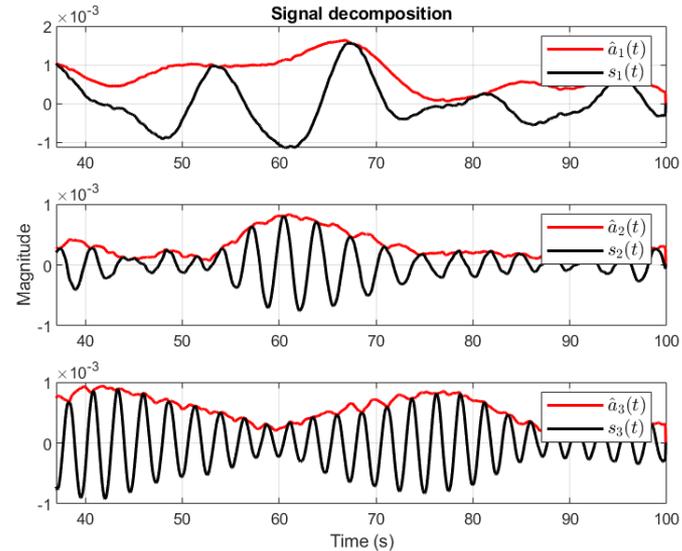

# PMU Location 5 Signal

Event Year: 2019

Event Length: 20 Seconds

Frequency and Damping Estimation

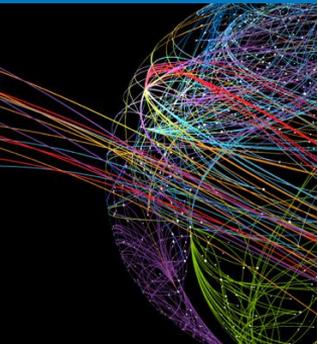

Signal Decomposition

We have five years of WAPA historical data. Big data analytics can be used to capture system anomalies through fault signature detection.

## Conclusion

NREL has initiated the development of a digital twin of the WAPA/WECC network. NREL focused on emulating the entire WECC network, with a specific emphasis on the WAPA network, using DRTS assets at ARIES.

- Grid Optimization: Digital Twins emulate the behavior of the grid under various conditions, such as blackouts, wildfires, etc.
- Grid Planning and Design: Digital Twins can emulate the impact of new infrastructure, such as renewable energy sources, and the grid's design control architecture, enhancing reliability and efficiency. Capex analysis
- Derisking: Digital twins help derisk the deployment of new technologies, and enhance resiliency of power systems
- Training: Digital Twins can be used to train operators and engineers in a safe and controlled environment, reducing the risk of grid anomalies and improving overall grid system reliability.
